# Installation and basic understanding of Unity software for Augmented Reality

## Build an Augmented Reality application having 3D object in it using Unity.

1. We create a new unity project
2. We add the following components
  - a. Vuforia AR Camera
  - b. Vuforia Mid Air Stage
  - c. Vuforia Mid Air Positioner
3. 3d Model of the virtual object as a child of the Mid Air Stage Component
4. Build the Application and run the app on your phone

## **Build an Augmented Reality application having Placement Indicator in it to summon 3D object in it using Unity**

1. We create a new unity project
2. Import ARCore and ARKit in the unity project
  - a. Add the AR Session Origin Game Object
  - b. Add the AR RayCast Component to it
  - c. Add the AR Plane Manager Component to it
3. Add the AR Session Game Object
4. Add an Event System to Handle the inputs
5. Create a Placement Indicator Game Object
6. Add a 3d quad shape as its child
  - a. Change the material of the quad to a target image
7. Add a controller object, which will interact with the AR session origin to display the virtual object.
  - a. Add an AR Placement Script to the virtual object with C# script
  - b. To the Controller now add the 3d object that we want to display
8. Build and run the application

## Build an Augmented Reality application using Unity for inserting multiple AR objects

1. We create a new unity project
2. Import ARCore and ARKit in the unity project
3. Add the AR Session Origin Game Object
  - a. Add the AR RayCast Component to it
  - b. Add the AR Plane Manager Component to it
4. Add the AR Session Game Object
5. Add an Event System to Handle the inputs
6. Create a Placement Indicator Game Object
  - a. Add a 3d quad shape as its child
  - b. Change the material of the quad to a target image
7. Add a controller object, which will interact with the AR session origin to display the virtual object.
  - a. Add an AR Placement Script to the virtual object with c#
  - b. Add the 3d object that you wish to insert in the controller
8. Build and run the application

## Build an Augmented Reality application using Unity for summoning multiple AR objects

1. We create a new unity project
2. Import ARCore and ARKit in the unity project
3. Add the AR Session Origin Game Object
  - a. Add the AR RayCast Component to it
  - b. Add the AR Plane Manager Component to it
4. Add the AR Session Game Object
5. Add an Event System to Handle the inputs
6. Create a Placement Indicator Game Object
  - a. Add a 3d quad shape as its child
  - b. Change the material of the quad to a target image
7. Add a controller object, which will interact with the AR session origin to display the virtual object.
  - a. Add an AR Placement Script to the virtual object with C# code
  - b. Add the 3d object that you wish to insert in the controller
8. Build and run the application

## **Build an Augmented Reality application using Unity to use arrows as placement indicator to summon multiple AR objects**

1. We create a new unity project
2. Import ARCore and ARKit in the unity project
3. Add the AR Session Origin Game Object
  - a. Add the AR RayCast Component to it
  - b. Add the AR Plane Manager Component to it
4. Add the AR Session Game Object
5. Add an Event System to Handle the inputs
6. Create a Placement Indicator Game Object
  - a. Add a 3d quad shape as its child
  - b. Change the material of the quad to a target image
7. Add a controller object, which will interact with the AR session origin to display the virtual object.
  - a. Add an AR Placement Script to the virtual object with the following c# code
  - b. Once the script is added, add the 3d models that you wish to cycle through.
8. 8. Create a Blank Canvas, which will contain the arrows
  - a. Insert buttons as children of the blank canvas
  - b. Change the target image of the buttons to arrow
  - c. Now update the runtime behaviour of the arrows
9. Build and run the application
